Walk More NATURALLY with Advanced Technology

Foot Drop is a condition where the muscles in the foot are too weak to properly lift the foot and toes while walking. The award-winning L300® Foot Drop System helps to alleviate walking challenges that may result from:

+ Stroke
+ Traumatic brain injury
+ Incomplete spinal cord injury
+ Multiple sclerosis

The L300 System is an advanced functional electrical stimulation (FES) system that stimulates the nerves in your lower leg, activating muscles to lift the foot which allows you to walk more naturally.

Walk Back Into Life

The L300 System offers a variety of proven advantages to help people with foot drop:

+ Provides a more natural movement when walking
+ Increase speed, stability and confidence
+ Reduce falls
+ Reeducate muscles
+ Prevent muscle loss (often called atrophy)
+ Maintain or increase range of motion in the ankle and foot
+ Increase blood flow
Experience the **FREEDOM** of Wireless Design

The L300 Foot Drop System consists of three small components that communicate with each other wirelessly and adapt to changes in walking speed and terrain. The components are rechargeable, eliminating the need for frequent and costly battery replacement.

1 **Ergonomic Leg Cuff**
   The comfortable leg cuff is free of control dials or switches and can be worn under most clothing without accidently changing your program settings.

2 **Intelli-Sense Gait Sensor**
   When you lift your foot, the Intelli-Sense Gait Sensor sends wireless signals to the leg cuff which stimulates the nerves to contract the muscles that lift your foot while walking.

3 **Wireless Control Unit**
   A small hand held control unit communicates wirelessly with the system and allows you to safely and easily adjust the stimulation on the go.

The Next Step **FORWARD**

Many people with foot drop also suffer from thigh weakness. The L300 Plus System is designed to give you better knee control and additional stability and provides an even greater sense of confidence and more energy to enjoy a variety of daily activities. The system adds a thigh cuff that delivers stimulation to activate the nerves controlling the major muscles of the leg.
